WRF-Var Data Assimilation Overview

- **Techniques:** 3D-Var, 4D-Var (**regional**), **Hybrid Variational/Ensemble DA**.
- **Software Engineering:** **WRF framework**.
- **Multiple Models:** Runs with WRF, **MM5, KMA global model, etc.**
- **Support:** MMM Division, NCAR.
- **Applications:** Regional/global, Research/Operational, Deterministic/Ensemble,

AIRS and Katrina

Korean T213/426 Global

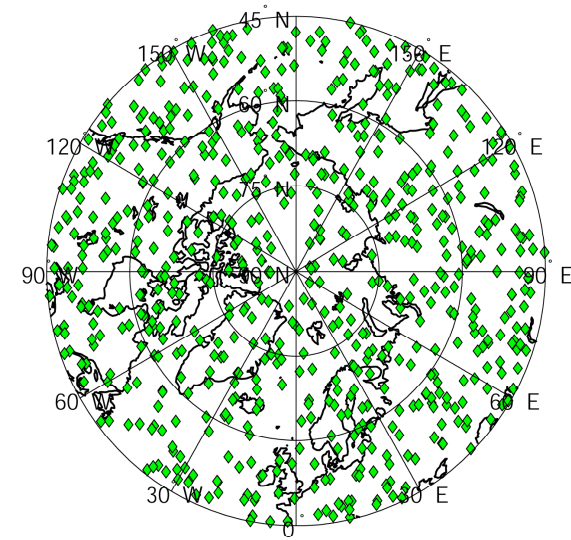

WRF-Var Observations

- Conventional:
 - Surface (SYNOP, METAR, SHIP, BUOY).
 - Upper air (TEMP, PIBAL, AIREP, ACARS).

- Remotely sensed retrievals:
 - Atmospheric Motion Vectors (geo/polar). →
 - Ground-based GPS Total Precipitable Water.
 - SSM/I oceanic surface wind speed and TPW.
 - Scatterometer oceanic surface winds.
 - Wind Profiler.
 - Radar.
 - Satellite temperature/humidities.
 - GPS refractivity (e.g. COSMIC). →

- Radiances:
 - SSM/I brightness temperatures.
 - Direct radiance assimilation (RTTOVS, CRTM).

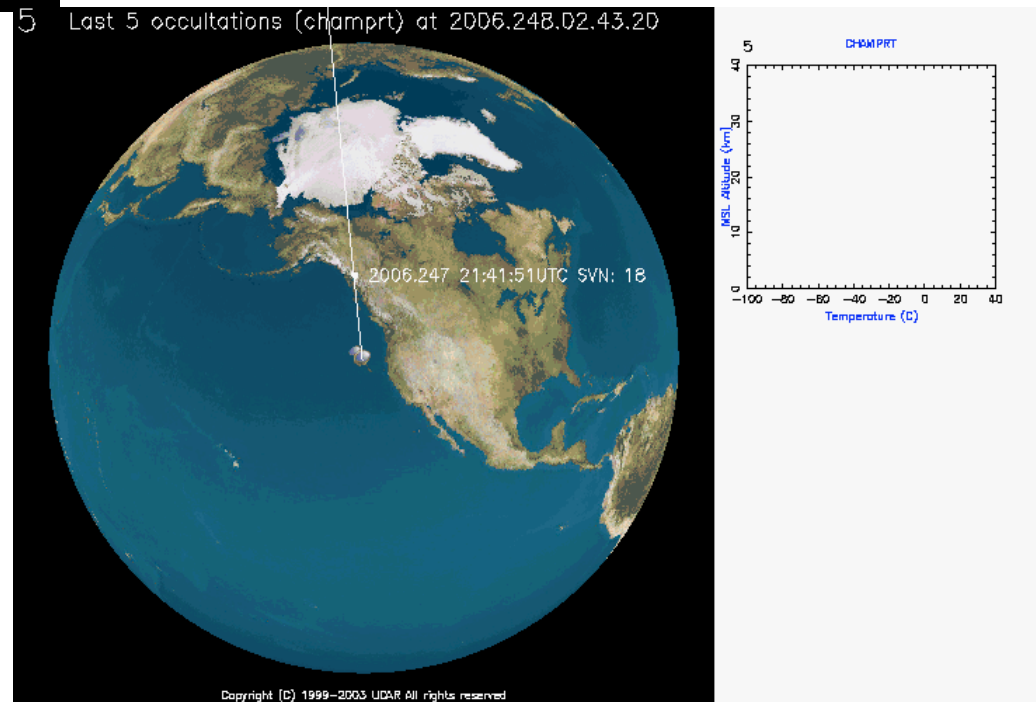

Courtesy: Bill Kuo

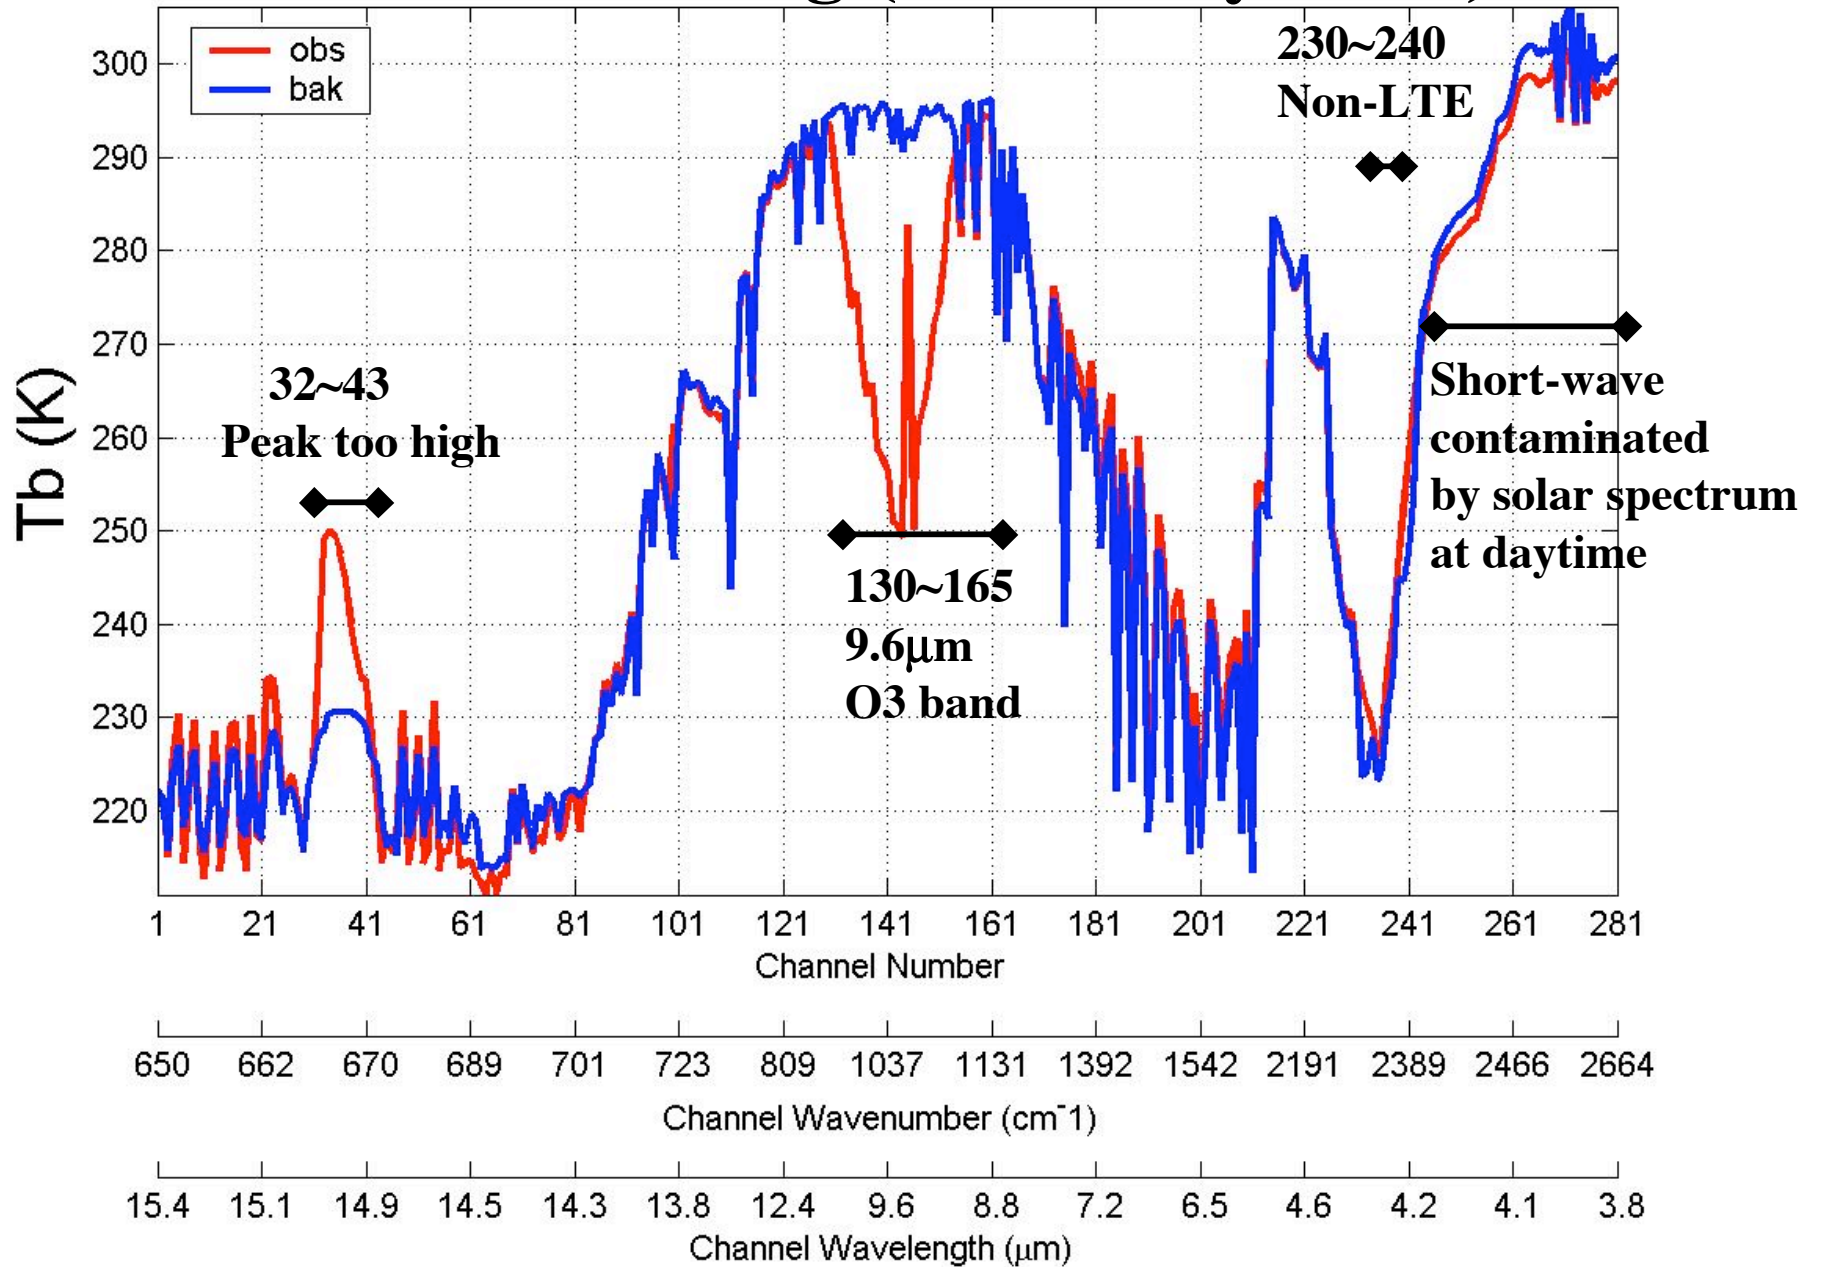

The LEO tracks the GPS phase while the signal is occulted to determine the Doppler shift

The velocity of GPS relative to LEO must be estimated to ~ 0.2 mm/sec (velocity of GPS is ~ 3 km/sec and velocity of LEO is ~ 7 km/sec) to determine precise temperature profiles

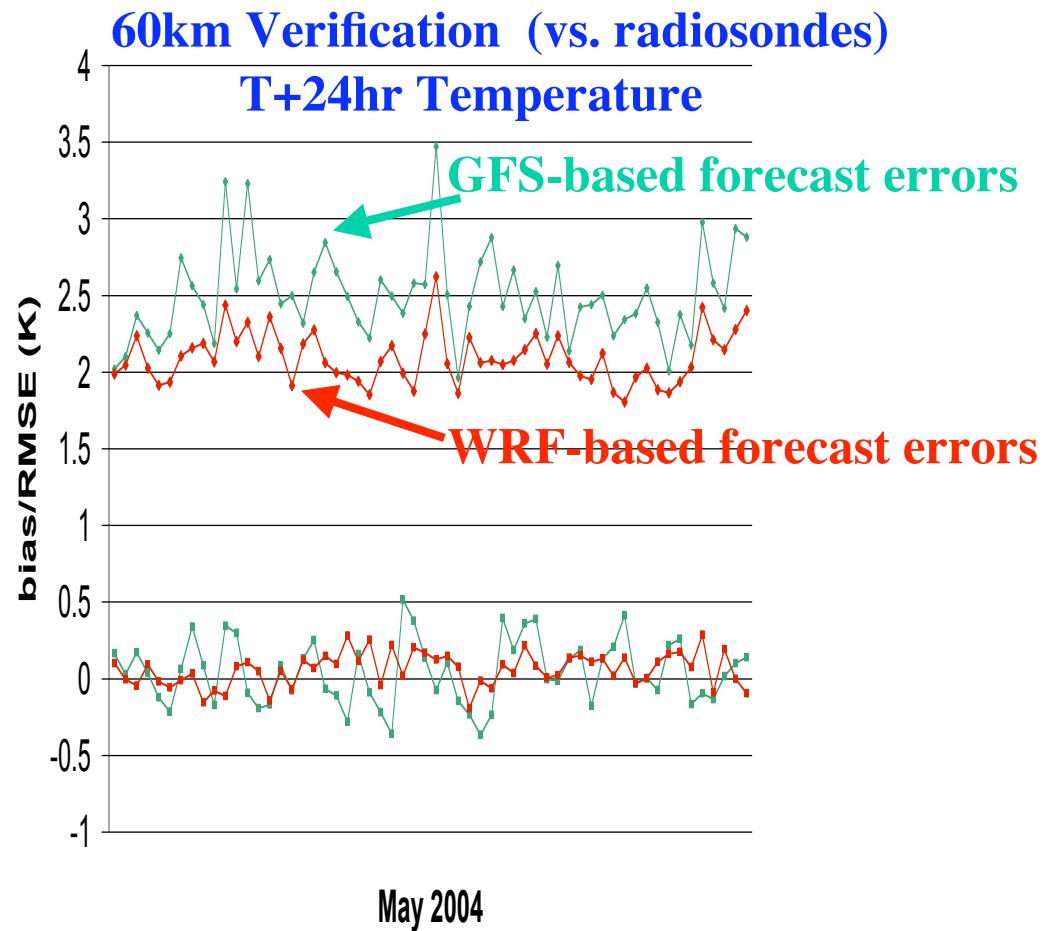

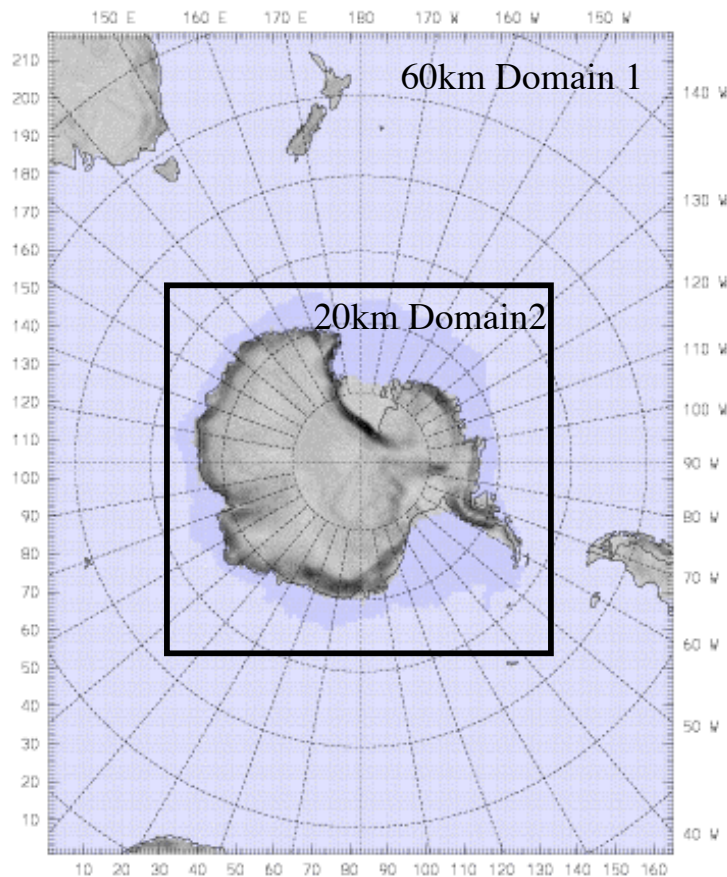

AIRS Monitoring (Clear-Sky Pixel)

AMPS Application Of WRF-Var

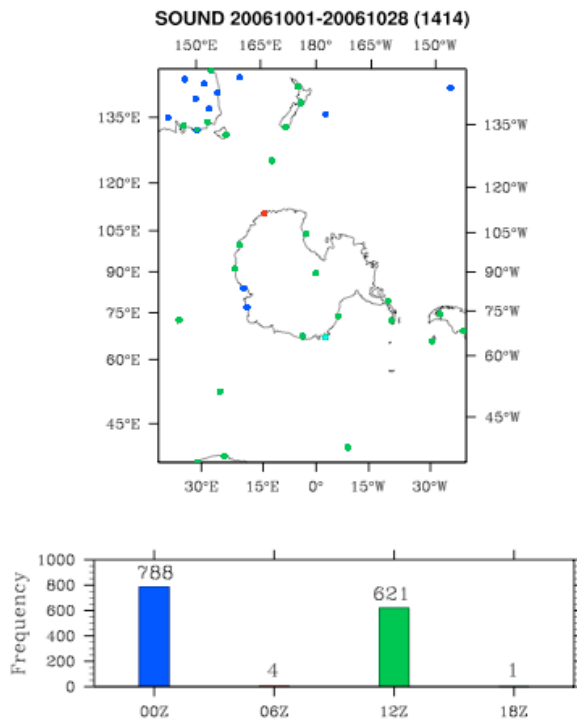

- WRF-Var is the operational data assimilation system for AMPS (MM5/WRF).
- Current Research Areas: Polar error covariances, full-cycling, COSMIC.

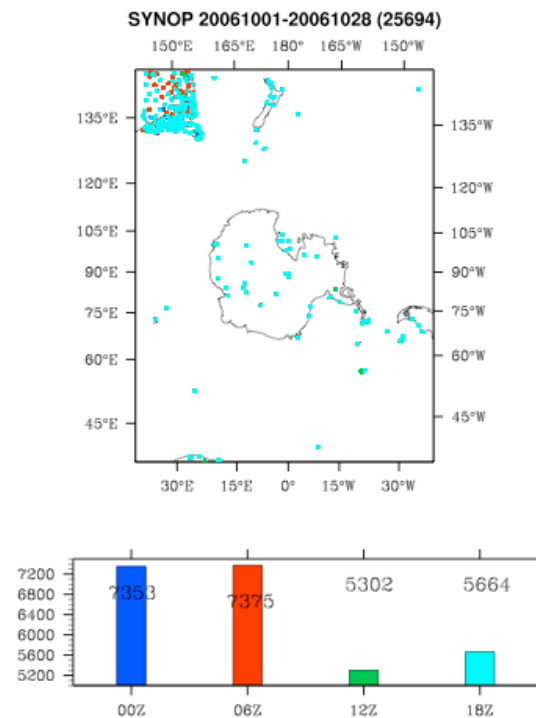

October 2006 Antarctic Testbed

- Initial benchmark studies use real-time AMPS 60km configuration.
- 1 - 31st October 2006 test period. 6 hourly full-cycling.
- Forecast verification against observations (south of 60S) and analyses.
- All available AMPS real-time observations + COSMIC.

COSMIC

Impact Of WRF-Var Quality Control (QC)

- 1st (gross) QC performed by observation preprocessor.
- 2nd (difference between ob and forecast) QC performed in WRF-Var.
- Main impact of 2nd QC is on surface observations.
- Rejection rates will reduce with higher resolution, higher-order interpolation.

Conclusions

- AMPS testing of WRF-Var focusing on impact of satellite data.
- Majority of AMPS DA effort is in observation QC/bias-correction, testing and tuning.
- QC has drastic effect on number of surface observations assimilated.
- COSMIC improves AMPS surface pressure, wind and tropospheric temperature forecasts.
- COSMIC degrades polar stratospheric temperature forecasts.
- Verification against obs and analyses gives **qualitatively** similar results.

Future Work

- Stratospheric noise in AMPS/WRF forecasts:
 - Model top (50hPA) too low.
 - Top boundary condition not optimal?
 - Lack of ozone in WRF?
- Diagnose and correct negative impact of COSMIC in stratosphere:
 - Tune COSMIC observation errors.
 - More rigorous QC (e.g. limit COSMIC data to below 300hPa).
- Test/tune AMSU, AIRS, SSM/IS radiances in AMPS.
- Increase horizontal (20km) and vertical (L51, 1-10hPa) resolution.
- Test advanced DA techniques (4D-Var and EnKF) in AMPS.
